Fly control measures should be part of an integrated program. Cost may vary, but programs such as ear tags, dusts, or sprays can cost around 3¢ to 5¢ per animal per day for fly control, and a quality mineral supplementation program will add an additional 10¢ to 12¢ per day.

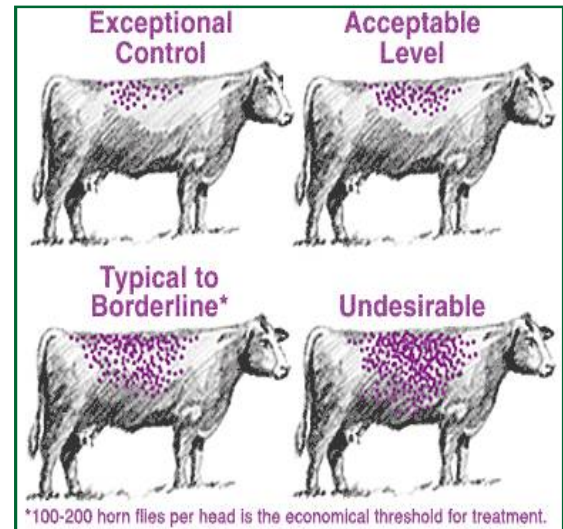

### The CRYSTALYX® Advantage for Fly Control

- CRYSTALYX® IGR or CRYSTALYX® Rolyx® provide fly control plus mineral vitamin supplementation for approximately 15¢ to 18¢ per day all in one convenient supplement delivery package (returnable steel barrel or the BioBarrel™). This fly control program reduces or nearly eliminates labor needs.
- Accuracy of nutrient delivery, assures proper consumption of nutrition and fly control compounds for effective fly control.
- CRYSTALYX® can be used to better manage cattle grazing distribution resulting in more effective pasture management — it pays to graze more days.

# Take Control of Fly Problems with CRYSTALYX<sup>®</sup> ROLYX<sup>®</sup> or CRYSTALYX<sup>®</sup> IGR Supplements

## Economic and Production Loss Occurs With Fly Infestation

- Weaning weights of calves can be reduced from 3% to 16% because horn flies reduce milk production in cows
- Grazing yearlings free of horn flies gain 15-50 lbs. more than heavily infested cattle.
- Stable flies can cause .10 to .48 lbs. of lost gain per day.

## Here's how it works:

- A. Your livestock consume RABON<sup>®</sup> on a regular basis as they lick the ROLYX<sup>®</sup> Supplement.
- B. The RABON<sup>®</sup> passes through the animal's digestive system.
- C. Cattle manure now contains RABON<sup>®</sup> that kills larvae before they reach the fly stage.
- D. IGR from CRYSTALYX<sup>®</sup> IGR Max<sup>™</sup> and Pro<sup>™</sup>, prevents horn fly larvae from maturing or developing to the adult stage.
